Marketing
101-Viral
Mailers n
Safelists-
Secure Vs
Non-Secure
Cheat Sheet**

1. Check all sites in a frame checker to make sure site being advertised shows in a frame.

(Most Clickbank and Warrior Plus sites don't.)

Make a splash page with a link to that site.

Site Checker

<https://iframetester.com/>

2. When advertising a non secure link(http) in a advertising site that is secure(in the address bar of your browser the advertising site starts with https) make sure you add an s to the end of the http so it becomes https then test in the iframe tester above to make sure it shows

TRACKING

3. If the site your advertising is a non-secure site ie http then the tracking link must also be http. If the site your advertising is a secure site ie (https), make sure you are using a tracking link that is also secure(https).

There CANNOT be a mismatch!

VIRAL MAIL PROFITS

4. If you are using Viral Mail Profits to send out your ads to the safelists YOU MUST use a https link or it WILL NOT show. If the site you are sending out in those ads is not secure just add an s to the http link. Make sure you check it.

5. ROTATORS- Make sure you check your links inside your rotators that they are congruent with the rotator link. If your rotator url(link) starts with http then the url's(links) inside must be http.

Conversly, if the rotator link is https then all links inside must be https. NOTE- You can check a affiliate link that u have as http by putting an s (https) and check it in another tab if it shows as secure then ur good to go.
